

ETC5512: Visualising Election Data

Table of contents

For this week's workshop I've organised for a special presentation by Linh Ngo. Linh is a former student in Wild Caught Data.

More recently she has been doing a research project with A. Prof. Damjan Vukcevic and Prof. Di Cook. Her research is focused on creating an R package that can be used to visualise election data. In particular, she is working on creating plots to show the vote distribution between different parties and across different electorates.

See [this article](#) for examples of the sorts of plots Linh is working on, and for more information on the changing relationship between the major parties and the independents.
